### The Status of Claims:

Claims 1-4 are pending.

Claims 1-4 have been rejected.

#### Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/30/2003 has been entered.

## Claim Rejections - 35 USC § 112

Claim 1 is rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for a catalyst, such as, Group VIII noble metal hydrogenation catalysts, does not reasonably provide enablement for all the catalysts known in the field of chemistry. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to include all the catalysts unrelated to the invention commensurate in scope with these claims. Furthermore, the instant specification fails to provide information that would allow the skilled artisan to practice the instant invention without <u>undue experimentation</u>.

Art Unit: 1625

Attention is directed to *In re Wands*, 8 USPQ2d 1400 (CAFC 1988) at 1404 where the court set forth the eight factors to consider when assessing if a disclosure would have required undue experimentation, citing *Ex Parte Forman*, 230 USPQ 546 (BdApls 1986) at 547 the court recited eight factors:

- 1) the quantity of experimentation necessary,
- 2) the amount of direction or guidance provided,
- 3) the presence or absence of working examples,
- 4) the nature of the invention,
- 5) the state of the prior art,
- 6) the relative skill of those in the art,
- 7) the predictability of the art, and
- 8) the breath of the claims.

In the instant case, the claim encompasses a number of multi-combined catalysts. However, applicants' specification provide only 6 particular exemplified catalyst compounds shown in the specification (see pages 9-13). Furthermore, the catalyst compositions represent an unpredictable aspect in the art of organic chemistry. See Exparte Sizto, 9 USPQ2d 2081 (Bd. Of App. And Inter. March 1988). Thus, the specification herein have failed to provide sufficient working examples to support the use of <u>numerous combinational catalysts</u>. Therefore, an appropriate correction is required.

Art Unit: 1625

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wada et al (WO98/24746), which is equivalent to Wada et al (U.S. 6,028,220).

Wada et al discloses a process for the preparation of acrolein and acrylic acid by carrying out the vapor phase catalytic oxidation of propylene with molecular oxygen or a gas containing molecular oxygen using a fixed bed multi-tubular reactor (see col. 1 ,lines 8-13). Furthermore, the reaction process for the production of acrolein and acrylic

Art Unit: 1625

acid can be performed by introducing a mixture gas consisting of 1 to 10 % by volume of propylene as the starting material (see col. 8 ,lines 26-29).

In the process, a plurality of oxidation catalysts having a composition of the following formula is employed:  $Mo_aBi_bNi_cCo_dFe_fY_gZ_hO_x$  where Mo, Bi, Ni, Co, and Fe represent molybdenum, bismuth, nickel, cobalt and iron, respectively; Y is at least one element selected from the group of tin, zinc, tungsten, manganese, magnesium, antimony and titanium; Z is at least one element selected from the group of potassium, rubidium, thallium, and cesium; a, b, c, d, f, g, h, and x represent the number of atoms of molybdenum, bismuth, nickel, cobalt, iron, Y, Z, and oxygen; a=12, b=0.1 to 7, c+d =0.5 to 20, f=0.5 to 8, g=0 to 2, h=0 to 1 and x is determined by the oxidized condition of each element (see col. 4 ,lines 13-29) in U.S. 6,028,220.

Moreover, the plurality of catalysts having different occupying volumes (see col. 2, lines 45-47) is set-up so as to form a catalyst layer into two or three parts depending on calcination temperature and time and the plurality of catalysts with an amount of at least 20 % by weight based on the sum of the supported catalyst(see col. 4, lines 40-41) in each of a plurality of reaction zones is arranged in such an order that the activity increases toward the outlet from the inlet of the material in the axial direction of the tube (see col. 8, lines 47-54).

Furthermore, the Wada et al. indicates that a plurality of catalysts having different occupying volumes are packed in such a manner that the occupying volume becomes smaller toward its outlet side from the inlet side of the reaction tube (see col. 2, lines 45-49). In addition, the activities of a plurality of catalysts are controlled by

Art Unit: 1625

changing composition of catalytically active components (kind and / or quantity of an alkali metal in particular) are packed in the reaction tube (see from col. 1 ,line 66 to col. 2 , line 2). Also, the powder containing catalytically active components is subjected to preliminary calcinations at a temperature of from 300 to 500° C. (see col. 5 ,lines 40-42).

However, the instant invention differs from the reference in that the amount of the alkali metal element and different occupying volumes for plural catalysts in the range are specified; and the term "molded" catalysts are not disclosed.

Concerning the unspecified amount of the alkali metal element and the unspecified, differently occupying volumes, the reference does describe in a different terminology that the plurality of catalysts having different occupying volumes (see col. 2 ,lines 45-47) is set-up so as to form a catalyst layer into two or three parts depending on calcination temperature and time and the plurality of catalysts with an amount of at least 20 % by weight based on the sum of the supported catalyst(see col. 4 ,lines 40-41) in each of a plurality of reaction zones is arranged in such an order that the activity increases toward the outlet from the inlet of the material in the axial direction of the tube (see col. 8 ,lines 47-54). In addition, the activities of a plurality of catalysts are controlled by changing composition of catalytically active components (kind and / or quantity of an alkali metal in particular) are packed in the reaction tube (see from col. 1 ,line 66 to col. 2 , line 2).

With respect to the absence of the term "molded" catalysts, this is directly related to the optimization of using the catalysts in the process. Furthermore, the shape

Art Unit: 1625

of the catalysts does have any patentable weight over the prior art reference. Therefore, it would have been obvious to the skilled artisan in the art to have motivated to mold the Wada's et al. catalysts in a proper shape by routine experimentations in order to obtain an optimum level for the catalytic activity during the process.

Furthermore, the limitation of a process with respect to the amount of the alkali metal element and occupying volumes does not impart patentability to a process when such values are those which would be determined by one of ordinary skill in the art in achieving optimum operation of the process in the absence of an unexpected result. Occupying volume is well understood by those of ordinary skill in the art to be a result-effective variable, especially when attempting to control selectivity of a chemical process. Therefore, it would have been obvious to the skilled artisan in the art to have motivated to adjust the Wada's et al amount of the alkali metal element and occupying volumes by routine experimentations in order to obtain the optimum ranges for the catalytic activity for the plurality of catalysts. This is because the skilled artisan would expect to increase the catalytic activity for the plurality of catalysts by the manipulation of the amount of the alkali metal element and occupying volumes.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Taylor Victor Oh whose telephone number is 703-305-0809. The examiner can normally be reached on 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alan Rotman can be reached on 703-308-4698. The fax phone numbers

for the organization where this application or proceeding is assigned are 703-308-2742 for regular communications and 703-305-7401 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-1235
